

EE229: Signal Processing-I

Lecture #3

Dept of Electrical Engineering
I.I.T. Bombay

Chapter 1: So far...

- Signals of various types and their relevance in the real world
- Useful measures (Energy, Power) defined for signals
- Simple transformations of the independent variable and math representations

Textbook

Alan V. Oppenheim and Alan S. Willsky with S.H. Nawab, Signals and Systems, Second Edition, PHI (Indian reprint: 2014)

Reference

B.P. Lathi, Principles of Signal Processing and Linear Systems, Oxford University Press, International Version 2009.

Some special signals

- Serve to represent other more general signals
- Can simplify system implementation
- Unit impulse, Unit step
- Exponential, Sinusoid

$$x(t) = e^{(\sigma + j\omega)t}$$

$\omega = 0$

$\sigma = 0$

Fig. 1.21 Sinusoids of complex frequency $\sigma + j\omega$.

Fig. 8.9 Discrete-time periodic signal.

$$x[n] = e^{\lambda n}$$

$$\lambda = \sigma + j\omega$$

$$\sigma > 0$$

$$\omega = 0$$

$$\sigma < 0$$

$$x[n] = \cos(\omega n)$$

$$\omega = \frac{2\pi}{12} \text{ rad/sample}$$

$$\omega = \frac{8\pi}{31} \text{ rad/sample}$$

Figure 1.26 (a) Growing discrete-time sinusoidal signals; (b) decaying discrete-time sinusoid.
